

CPC Hand-Coding Disagreement Report

Coders: Tyler, Jacob **Files:** cpc_llm_training_labels_tyler.xlsx, cpc_llm_training_labels_jacob.xlsx
Matched on: shared_id

Scope

Of 100 shared IDs, **10 documents were coded by both** (coding_complete==1): C006, C007, C009, C014, C020, C041, C056, C089, C093, C094. This report covers agreement on those 10.

Header mismatch: Tyler uses approved_unresolved_objection; Jacob uses approved_despite_unresolved_objection. Treated as the same field — should be aligned.

Overall agreement

Across 18 label columns $\times$ 10 docs, **153/180 cells agree (85%)**.

Perfect agreement (10/10): specific_project, local_opposition, councilmember_position, affordability_displacement, coding_confidence.

Lowest-agreement columns:

Column	Agreement
local_request_condition	60%
scale_character_preservation	60%
dev_direction	70%
approved_despite_unresolved_objection	70%
revision_or_concession	80%
procedural_response	80%
explicit_local_response	80%
bp_request_or_opposition	80%

Key pattern

The 27 disagreements are **not random**. On nearly every binary conflict, **Jacob codes 1 (feature present) and Tyler codes 0 (absent)**. All disagreements in local_request_condition, scale_character_preservation, approved_despite_unresolved_objection, revision_or_concession, and bp_request_or_opposition run Jacob=1 / Tyler=0. The one reversal is explicit_local_response on C014 (Tyler=1, Jacob=0). This points to a **different threshold for “feature present,”** not scattered noise.

Categorical (non-binary) disagreements

- **C007** dev_direction: Tyler upzone vs Jacob none
- **C089** dev_direction: Tyler none vs Jacob upzone
- **C020** dev_direction: Tyler none vs Jacob mixed; civic_group_position: Tyler none_or_procedural vs Jacob support_or_request

Most-contested documents

- **C009** — 6 disagreements
- **C020** — 6 disagreements
- **C056** — 5 disagreements
- **C014** — 4 disagreements

Recommended next steps

1. Align the `approved_(despite_)unresolved_objection` column name.
2. Reconcile the “present/absent” threshold, starting with `local_request_condition` and `scale_character_preservation`.
3. Adjudicate the three `dev_direction` cases (C007, C020, C089) as genuine judgment splits.

Tyler’s notes — sources of confusion

A couple points of confusion, which likely explain much of the systematic Jacob=1 / Tyler=0 pattern above:

1. **Issue-area undercounting.** I undercounted mention of issue areas because I interpreted the question as being whether locals were *concerned* with those issues, and not just whether those issues were *mentioned* in the report. I think it makes sense to code the conditions as you did and still flag them even if opposition did not raise the points exactly.
2. **Minor conditions as opposition.** I was sort of unwilling to classify pretty minor conditions as evidence of opposition from the borough president or community board. As an example, consider the **77th St Boarding Home (C009)**. The conditions added were:
 - For a three year period, the property should be maintained in an attractive manner.
 - Health and social services should make regular visits to the site.

The borough president went along with these conditions. In my opinion these are pretty minor and shouldn’t lead to the coding of opposition from either the community board or borough president. Obviously, this creates a judgement call.

This also led us to code `local_request_condition` differently. Any time there was no verbal opposition at a hearing, I said there was not a `local_request_condition`, whereas it seems like you did in this case because of the conditions.

3. **“Upzone” for Park Housing (C007).** I called park housing an upzone because it was associated with the construction of increased density — “upzone” isn’t quite the right word here but seems like it should still be coded as a pro-development project.
